

Comprehensive Domain Fix Report

Date: December 30, 2024
Issue: Redirect still using old domain despite previous fixes
Root Cause: Stale build artifacts in dist/ folder

Investigation Summary

Problem Identified

The built JavaScript bundle in `dist/assets/index-CMRplsgN.js` contained **outdated code** with:

- ❌ Wrong domain: Using old parameter names
- ❌ Wrong parameters: `prefilled_email` and `client_reference_id`
- ✅ Should be: `email` and `session_code`

Search Results

1. Old Domain Search (`report.emigrationpro.com`)

```
grep -r "report.emigrationpro.com" . --include="*.ts" --include="*.tsx" --in-  
clude="*.js" --include="*.jsx"
```

Result: ✅ **NO INSTANCES FOUND** in source code

2. Old Parameter Names Search

```
grep -rn "prefilled_email|client_reference_id" --include="*.ts" --include="*.tsx"
```

Result: ✅ **NO INSTANCES FOUND** in source code

3. New Domain Verification (`emi-pro-report-584996805327.us-west1.run.app`)

Result: ✅ **Found in 3 locations** (all correct)

Current URL Configuration

File 1: EmailCaptureModal.tsx (Frontend)

Location: `/src/react-app/components/EmailCaptureModal.tsx:60`

```
// Fallback: Use default report generation app link  
window.location.href = `https://emi-pro-report-584996805327.us-west1.run.app/?email=$  
{encodeURIComponent(email.toLowerCase())}&session_code=${data.session_code || ''}`;
```

✅ **Status:** CORRECT

- Domain: `emi-pro-report-584996805327.us-west1.run.app`
- Parameters: `email` and `session_code`

File 2: worker/index.ts (Backend - Line 1282)

Location: /src/worker/index.ts:1282

```
// Return success with redirect URL to report generation app
const reportAppUrl = `https://emi-pro-report-584996805327.us-west1.run.app/?email=${encodeURIComponent(normalizedEmail)}&session_code=${sessionCode}`;

return c.json({
  success: true,
  message: "Email captured successfully. Redirecting to report generation...",
  session_code: sessionCode,
  access_id: accessId,
  email: normalizedEmail,
  report_url: reportAppUrl // This is sent back to the frontend
});
```

✓ **Status:** CORRECT

- Domain: emi-pro-report-584996805327.us-west1.run.app
- Parameters: email and session_code

File 3: worker/index.ts (Backend - Comment Line 1162)

Location: /src/worker/index.ts:1162

```
// Email gateway endpoint - For report generation app access
// Creates CRM record and redirects to https://emi-pro-report-584996805327.us-west1.run.app/
```

✓ **Status:** CORRECT (documentation comment)

Fix Applied

Action Taken: Delete Stale Build Folder

```
cd /home/ubuntu/emigration_pro_frontend
rm -rf dist/
```

Reason: The dist/ folder contained compiled JavaScript with the OLD code:

- Old parameters: prefilled_email and client_reference_id
- This was causing the redirect to use wrong parameter names

Why This Fixes It:

1. The dist/ folder is **NOT tracked by git** (in .gitignore)
 2. Netlify/deployment will **rebuild from source** on next deploy
 3. The rebuilt code will use the **correct parameters** from source files
-

✓ Verification Checklist

- [x] No instances of `report.emigrationpro.com` in source code
- [x] No instances of `prefilled_email` or `client_reference_id` in source code
- [x] New domain `emi-pro-report-584996805327.us-west1.run.app` correctly used in 3 locations
- [x] Correct parameters `email` and `session_code` used in all locations
- [x] Stale dist/ folder deleted
- [x] `.gitignore` confirms dist/ is not tracked
- [x] Ready for fresh build on deployment

🎯 Expected Redirect URL Format

After the fix, the redirect URL will be:

```
https://emi-pro-report-584996805327.us-west1.run.app/?
email=USER_EMAIL&session_code=SESSION_CODE
```

Example:

```
https://emi-pro-report-584996805327.us-west1.run.app/?
email=gthopebt%40gmail.com&session_code=a323218d-3b2a-4fdd-a939-fbe2e5e2462d
```

🚀 Deployment Instructions

1. **Commit and Push** (if any tracked files changed)
2. **Netlify will automatically rebuild** from the source code
3. **The new build will use correct parameters** from `EmailCaptureModal.tsx` and `worker/index.ts`

📊 File Locations Summary

File	Line	Status	Notes
<code>EmailCaptureModal.tsx</code>	60	✓ Correct	Frontend redirect fall-back
<code>worker/index.ts</code>	1282	✓ Correct	Backend report URL generation
<code>worker/index.ts</code>	1162	✓ Correct	Documentation comment

No Environment Variables Found

Checked for any `.env` or `.env.local` files:

```
ls -la | grep -E "\.env|\.local"
```

Result: No environment variable files found

Conclusion

Root Cause: Stale build artifacts in dist/ folder

Solution: Deleted dist/ folder - fresh build will use correct source code

Verification: All source files have correct domain and parameters

Next Step: Deploy to Netlify to generate fresh build from source

Report Generated: December 30, 2024

Status:  READY FOR DEPLOYMENT
